Animal and Meat Production in Ghana: An Overview
ABSTRACT: Animal production is an integral part of Ghana's agricultural economy and a major source of livelihood for many rural people. The data generated through this study will be useful for researchers, farmers, and other stakeholders who will use this data in planning and making of policies, and to monitor changes that may occur overtime.

Key words: Agricultural economy, Animal production, Animal species, Meat production, Ghana.

Conventional and molecular detection of Newcastle disease and infectious Bursal disease in chickens

ABSTRACT: The present study was undertaken to compare different diagnostic procedures for the detection of Newcastle disease and infectious Bursal disease in chickens. The study employed a variety of conventional and molecular methods to assess the reliability, sensitivity, and specificity of these methods. The results showed that the molecular methods were more reliable, sensitive, and specific compared to the conventional methods, and thus more accurate for the confirmatory diagnosis of diseases.

Rural poultry farming with improved breed of backyard chicken
Livestock and poultry rearing is an imperative factor for improving the nutritional security of rural poor in India. Rural farmers rear Desi type chicken with low egg and meat production in backyard system. For developing the rural poultry farming, improved and sustainable backyard rearing system is a solution to food security to the needy villagers paving a way for sustainable agriculture in rural areas of India.

Keywords: Backyard Chicken, Gramapriya, Rural, Vanaraja

A study on Cestode Parasites of Corvus Species of Kashmir, India
ABSTRACT: During the present study, three species of the genus Corvus namely Corvus monedula, C. splendens and C. macrorhynchos were collected from different localities of Kashmir valley and investigated for the presence of cestode parasites. Anomotaenia galbulae (Gmelin, 1790) Furhrmann, 1932 was recovered from all the three host species. While, Choanotaenia micracantha was recovered only from C. monedula and no specimen of this cestode was obtained from C. Splendens and C. macrorhynchos during the present study. The specimens thus collected were identified as Anomotaenia galbulae and Choanotaenia micracantha on the basis of various morphological and morphometric characters when compared to the known species of genera Anamotaenia and Choanotaenia respectively. However, some intraspecific variations were observed.

Key words: Cestode, Crows, Anomotaenia, Choanotaenia, Kashmir, Morphology.

Effect of Dietary Inclusion of Zataria multiflora on Histological Parameters of Bursa of Fabricius in Broilers

ABSTRACT: Regarding the remarkable role of bursa of Fabricius as a primary lymphoid organ in poultry, this study aimed to evaluate the effect of long term administration of Zataria multiflora as an herbal immunomodulatory agent on histological features of this organ in broiler chickens. To this end, fifty, one-day old chickens were randomly divided into five equal groups and fed with diets contained 0.5, 1, 1.5, and 2% of Z. multiflora (experimental groups) or basal diet (control group) for 45 days. On day 46, birds were slaughtered and bursa of Fabricius were collected and fixed in formalin for histological examination. For histomorphometric analyses, two sections of bursa were cut perpendicularly and a linear graticule was used for measurement. Number of follicles in plicae was also counted under light microscope. The results showed a dose dependent increase in all histomorphometric parameters due to Z. multiflora administration and the highest increase was in the thickness of follicular cortex of birds treated with 2% Z. multiflora.

In conclusion, dietary inclusion of Z. multiflora during the rearing period of broilers, dose dependently affects histological structures of bursa of Fabricius in a way that may enhance its role as a lymphoid organ.

Key words: Bursa of Fabricius; Histology; Zataria multiflora; Broilers.
